

**KANTIPUR ENGINEERING COLLEGE**  
**Dhapakhel, Lalitpur**  
**Model Entrance Test (2073)**  
**Solution Set: III (B)**

**Section: I**

1. (B)                      2. (C)                      3. (A)                      4. (D)                      5. (D)  
 6. (D)                      7. (A)                      8. (A)                      9. (A)                      10. (C)  
 11. (C)                      12. (C)                      13. (B)                      14. (B)

15. (B)  $n\{(A \times B) \cap (B \times A)\} = \{n(A \cap B)\}^2 = 2^2 = 4$

16. (B) for both roots to be zero, constant term = 0, coefficient of x = 0

$$\begin{aligned} \Rightarrow n &= 0, & m - 7 &= 0 \\ \Rightarrow m &= 7, & n &= 0 \end{aligned}$$

17. (A)  $7 \cos^2 x + 3 \cos^2 x = 4$   
 $7 \sin^2 x + 3 - 3 \sin^2 x = 4$

$$4 \sin^2 x = 1 \quad \sin^2 x = \frac{1}{4} = \sin^2 \frac{\pi}{6} \Rightarrow x = n\pi \pm \frac{\pi}{6}$$

18. (C) Here  $A = I$ , So  $A^2 + 2 = I^2 + 2A = I + 2A = A + 2A = 3A$

19. (D)  $\lim_{x \rightarrow 1} \frac{x + 2x + 3x^2 + \dots + nx^{n-1}}{1} = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$

So  $\frac{n(n+1)}{2} = 66 \Rightarrow n = 11$

20. (D)  $\tan^{-1} \frac{3x - x^3}{1 - 3x^2} = 3 \tan^{-1} x$  so  $\frac{d}{dx} \frac{3 \tan^{-1} x}{1 + x^2} = \frac{3}{1 + x^2}$

21. (A)  $\int \tan^{-1} \left( \frac{1 - \tan^2 x}{1 + \tan^2 x} \right) dx = \int \cos^{-1} \cos 2x dx = \int 2x dx = x^2 + c$

22. (C) Here,  $\vec{a} \times \vec{b} = -(\vec{b} \times \vec{a})$  so angle between  $\vec{a} \times \vec{b}$  and  $\vec{b} \times \vec{a} = 180^\circ$

23. (B) As, (h, 0), (o, k) and (3, 3) are collinear so

$$\frac{k - 0}{o - h} = \frac{3 - k}{3 - o}$$

$$\Rightarrow 3k = -3h - hk \Rightarrow 3h + 3k = hk \Rightarrow \frac{1}{h} + \frac{1}{k} = \frac{1}{3}$$

24. (B) length of the line =  $\sqrt{2^2 + 3^2 + 6^2} = \sqrt{49} = 7$

25. (D)                      26. (C)                      27. (A)                      28. (D)                      29. (B)  
 30. (A)                      31. (C)                      32. (C)                      33. (B)                      34. (D)  
 35. (A)                      36. (B)                      37. (D)                      38. (C)

39. (A) The narrower the diameter of the tube, the greater will be the rise of the liquid in the tube.

40. (B) In elastic collision, K.E. is conserved

41. (D) In radiation, the heat is transferred at the speed of the light.
42. (A)  $\sin c = 1/\mu$  ;  $\mu$  for violet color is largest and hence the critical angle for violet color is minimum.
43. (C) The transverse nature of the light is shown by polarization of light
44. (A) There will be mutual repulsion. Hence the radius will increase
45. (A) We know that heater draws a high current from the mains. So, there is appreciable potential drop in line. As the potential difference in the bulbs falls and hence they become dim
46. (C) At poles, the horizontal component of the earth's magnetic field is zero and hence the compass needle will be vertical
47. (B) Inner walls of the big halls should be a good sound absorber to avoid echo and overlapping of sound

48. (C) We know that  $\lambda = \frac{h}{mv} = \frac{h}{p}$  so they will have the same momentum

49. (B)  
50. (D)  
51. (D)

52. (B) **Solution:**

$$1 \text{ mol of He} = 4 \text{ g} = 6.023 \times 10^{23} \text{ atoms}$$

$$\text{Wt. of } 6.023 \times 10^{23} \text{ atoms He} = 4 \text{ g}$$

$$\text{Wt. of 1 atom} = \frac{4}{6.023 \times 10^{23}} = 6.64 \times 10^{-24} \text{ g}$$

53. (C)                      54. (A)                      55. (A)                      56. (B)
57. (C)                      58. (D)                      59. (B)                      60. (D)

**Section: II**

61. (A)                      62. (C)
63. (C) function is defined if  $4x - x^2 \geq 0 \Rightarrow x(4-x) \geq 0$

$$\Rightarrow 0 \leq x \leq 4 \Rightarrow [0, 4]$$

Also  $4 - y^2$  is a positive square root. So  $y \geq 0$  .....range =  $[0, 2]$

$$(x-2)^2 \geq 0 \Rightarrow 4 - y^2 \geq 0$$

64. (A)  $\sin 2A + \sin 2B = \sin 2C$   
Or,  $2 \sin(A+B) \cos(A-B) = 2 \sin C \cos C$   
 $\Rightarrow \sin C \cos(A-B) = \sin C \cos C$   
 $\Rightarrow \cos(A-B) = \cos C$  [ ..... $C \neq 0$ ]  
 $\Rightarrow A - B = C$   
 $\Rightarrow A = B + C$

65. (B)  $\frac{n(n-1)}{2} = 153 \Rightarrow n = 18$

66. (D)  $a, b, c$  are in A.P.  $\Rightarrow b = \frac{a+c}{2}$

$b, c, d$  are in G.P.  $\Rightarrow c^2 = bd$

$c, d, e$  are in H.P.  $\Rightarrow d = \frac{2ce}{c+e}$

so  $c^2 = \frac{a+c}{2} \cdot \frac{2ce}{c+e}$

$\Rightarrow c^2 = ae$

$\Rightarrow a, c, e$  are in A.P.

67. (A)  $\frac{a+ib}{c+id} \times \frac{c-id}{c-id} = \frac{ac+bd}{c^2+d^2} + i \frac{bc-ad}{c^2+d^2}$  which is purely real if  $bc - ad = 0$

$\Rightarrow ad = bc$

68. (A)  $tn = \frac{1+2+2^2 + \dots + 2^{n-1}}{n!} = \frac{2^n - 1}{n!} = \frac{2n}{n!} - \frac{1}{n!}$

$\sum_{n=1}^{\infty} tn = \sum_{n=1}^{\infty} \frac{2n}{n!} - \sum_{n=1}^{\infty} \frac{1}{n!} = e^2 - e$

69. (C) Given  $\vec{a} + \vec{b} + \vec{c} = 0$

$\vec{a} + \vec{b} = -\vec{c}$

$(\vec{a} + \vec{b})^2 = (-\vec{c})^2$

$\Rightarrow 2 \cdot 3 \cdot 5 \cos \theta = 15$

$\Rightarrow \cos \theta = \frac{1}{2} \Rightarrow \theta = 60^\circ$

70. (C) The equation of bisectors of angle between the lines  $ax^2 - 2hxy + by^2 = 0$ , is

$-h(x^2 - y^2) = (a-b)xy$  i.e.  $h(x^2 - y^2) + (a-b)xy = 0$

If  $y = mx$  is one of the bisectors then

$h(x^2 - m^2 x^2) + (a-b)x \cdot mx = 0$

$\Rightarrow h(1 - m^2) + (a-b)m = 0$

71. (D) The circles cut orthogonally if  $2g_1 g_2 + 2f_1 f_2 = C_1 + C_2$

$\Rightarrow 2 \cdot \lambda \cdot 2 + 2 \cdot 3 \cdot 1 = 1 + 0$

$\Rightarrow 4\lambda + 6 = 1$

$\Rightarrow \lambda = -5/4$

72. (D) Parabola is  $y^2 = kx - 8 \Rightarrow y^2 = \frac{4k}{4} \left(x - \frac{8}{k}\right)$

Equation of directrix  $\rightarrow x - 1 = 0$

So,  $1 = \frac{8}{k} - \frac{k}{4}$

$\Rightarrow 4k = 32 - k^2$

$\Rightarrow k^2 - 4k - 32 = 0 \Rightarrow k = 8, -4$

73. (B) coordinates of A = (3a, 0, 0)

“ B = (0, 3b, 0)

$\therefore$  centroid (a, b, c)

“ C = (0, 0, 3c)

74. (B)  $y = \sqrt{\sin x + y} \Rightarrow y^2 = \sin x + y$

$$\Rightarrow 2y \frac{dy}{dx} \cos x + \frac{dy}{dx} \Rightarrow (2y - 1) \frac{dy}{dx} - \cos x = 0$$

75. (D)  $f'(x) = \sec^2 x - 1 = \tan^2 x > 0$

76. (D)  $f'(x) = e^x + \frac{1}{1+x^2} \Rightarrow f(x) = e^x + \tan^{-1}x + c$

$$\Rightarrow f'(0) = 1 + 0 + c$$

$$\Rightarrow 1 = 1 + 0 + c \Rightarrow c = 0$$

$$\text{So, } f(x) = e^x + \tan^{-1}x$$

77. (B) Along x-axis  $y = 0 \Rightarrow x = 0, 4$

$$\therefore \text{Required area} = \int_0^4 (4x - x^2) dx$$

$$= \left[ 2x^2 - \frac{x^3}{3} \right]_0^4 = 32 - \frac{64}{3} = \frac{32}{3}$$

78. (C)

79. (A)

80. (A)

81. (B)

82. (C) Here  $\Delta v = (8j - 6i) \text{ m/s}$

$$\therefore |\Delta v| = \sqrt{(8)^2 + (6)^2} = 10 \text{ m/s}$$

$$\text{Now, } a = \frac{\Delta v}{\Delta t} = \frac{10}{10} = 1 \text{ m/s}^2$$

83. (D) Here  $h = ut + \frac{1}{2}gt^2$  [ $\because u = 0$ ]

$$\therefore \frac{h_1}{h_2} = \left(\frac{t_1}{t_2}\right)^2 \Rightarrow \frac{t_1}{t_2} = \sqrt{\frac{h_1}{h_2}}$$

$$\Rightarrow \frac{t_1}{t_2} = \sqrt{\frac{16}{25}} = \frac{4}{5}$$

84. (B) When the lift is moving upwards, then

$$W = m(g+a)$$

$$\text{Here } a = 4.9 \text{ m/s}^2 \therefore W = m\left(g + \frac{g}{2}\right) = \frac{3}{2}mg = \frac{3}{2} \times 60 = 90 \text{ N}$$

85. (D) The stress required to double the length is called Young's Modulus.

$$Y = \frac{F}{A} \Rightarrow F = Y \times A \therefore F = 2 \times 10^{11} \times 10^{-4} = 2 \times 10^7 \text{ N}$$

86. (A) If H be the height to which a liquid rises in the inclined tube, then

$$H = \frac{h}{\sin \theta} \therefore H = \frac{h}{\sin 45^\circ} = \frac{h}{1/\sqrt{2}} = \sqrt{2} h$$

87. (C)  $\frac{C}{100} = \frac{F - (\text{LFP})}{(\text{UFP}) - (\text{LFP})}$

Where C = actual temperature  
 F = reading on faulty thermometer  
 LFP = lower fixed point

UFP = upper fixed point  $\therefore \frac{C}{100} = \frac{41-5}{95-5} = \frac{36}{90} \Rightarrow C = 40^\circ \text{C}$

88. (C)  $dQ = dU + dW$   
 $35 = dU + (-15)$   
 $\therefore dU = 50 \text{ J}$

89. (A) We know that,  $f = \frac{1}{2l} \sqrt{\frac{T}{m}} \propto \sqrt{T}$   
 $\therefore \frac{f_2}{f_1} = \sqrt{\frac{T_2}{T_1}} \Rightarrow T_2 = \left(\frac{f_2}{f_1}\right)^2 T_1$

Given that  $f_2 = 2f_1$  and  $T_1 = 10 \text{ N}$ .  $\therefore T_2 = \left(\frac{2f_1}{f_1}\right)^2 \times 10 = 40 \text{ N}$

90. (B)  $M = \frac{I}{O} = \frac{v-f}{f} = \frac{75-25}{25} = 2$   
 $\therefore I = 2 \times O = 2 \times 1.5 = 3.0 \text{ cm}$

91. (D)  $I_{\max} = (a_1 + a_2)^2 \Rightarrow$  when  $a_1 = a_2$   
 $I_{\max} = 4a^2 = I_0$

When one slit is closed then,  $I = a^2 = \frac{I_0}{4}$

92. (A) From  $T = 2\pi \sqrt{\frac{I}{MB}}$ ,  $4 = 2\pi \sqrt{\frac{I}{MB}}$

When it is cut into two equal parts in length, mass of each part becomes  $\frac{1}{2}$ ;

$I = \text{mass} \frac{(\text{length})^2}{12}$  becomes  $\frac{1}{8}$  and  $M$  becomes  $\frac{1}{2}$

$T' = 2\pi \sqrt{\frac{I/8}{M/2 \cdot B}} = \frac{1}{2} \left( 2\pi \sqrt{\frac{I}{MB}} \right) = \frac{1}{2} \times 4 = 2 \text{ sec}$

93. (A)  $V = \frac{C_1 V_1 + C_2 V_2}{C_1 + C_2} = \frac{(20 \times 10^{-6} \times 500) + (10 \times 10^{-6} \times 200)}{(20 \times 10^{-6}) + (10 \times 10^{-6})}$   
 $= 400 \text{ V}$

94. (C)  $R_s = R + 2R = 3R$   
 and  $R_p = \frac{(R \times 2R)}{3R} = \frac{2}{3}R$   
 Heat produced in series =  $i^2 3R$   
 Heat produced in parallel =  $i^2 \frac{3}{2}R$   
 $\therefore$  Ratio of heat produced =  $\frac{i^2 3R}{i^2 (\frac{2}{3})R} = \frac{9}{2} = 9:2$

95. (C) As  $v = \frac{hc}{\lambda e} - \phi_0$   
 $= \frac{4.14 \times 10^{-15} \times 3 \times 10^8}{2000 \times 10^{-10} \times 1} - 5.01$

$$= (6.21 - 5.01) \text{ eV} = 1.2 \text{ eV}$$

96. (D) The ratio of left mass to original mass

$$= \frac{1}{16} = \left(\frac{1}{2}\right)^4$$

$$\left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^{t/T} \Rightarrow t = 4T$$

$\therefore$  half life of the substance is

$$\therefore T = \frac{t}{4}$$

Here  $t = 120$  days  $\therefore T = \frac{120}{4} = 30$  days

97. (D)

98. (B) Solution:  $Q = I \times t$

$$= 0.873 \times 3 \times 60 = 157.16 \text{ Coulomb}$$

2 F can deposit 63.5 g of Cu

2 × 96500 Coulomb deposit 63.5 g

$$157.16 \text{ coulomb deposit } = \frac{63.5 \times 157.14}{193000} = 0.0517 \text{ g}$$

99. (B) Solution: By normality equation the new concentration of the solution can be calculated

$$V_1 = 250 \text{ ml} \quad S_1 = 0.25 \text{ M} \quad V_2 = 500 \text{ ml} \quad S_2 = ?$$

or  $S_2 = \frac{V_1 \times S_1}{V_2} \quad S_2 = \frac{250 \times 0.25}{500} = 0.125 \text{ M}$

100. (D)

\*\*\*\*\*
